

LARGE SIEVE INEQUALITY WITH CHARACTERS FOR POWERFUL MODULI

STEPHAN BAIER AND LIANGYI ZHAO

ABSTRACT. In this paper we aim to generalize the results in [1],[2],[19] and develop a general formula for large sieve with characters to powerful moduli that will be an improvement to the result in [19].

keywords: large sieve inequality; power moduli.

Mathematics Subject Classification 2000: 11N35, 11L07, 11B57

1. INTRODUCTION

Throughout this paper, we reserve the symbols c_i ($i = 1, 2, \dots$) for absolute positive constants. Large sieve was an idea originated by J. V. Linnik [10] in 1941 while studying the distribution of quadratic non-residues. Refinements of this idea were made by many. In this paper, we develop a large sieve inequality for powerful moduli. More in particular, we aim to have an estimate for the following sum

$$(1.1) \quad \sum_{q \leq Q} \sum_{\substack{a=1 \\ (a,q)=1}}^{q^k} \left| \sum_{n=M+1}^{M+N} a_n e\left(\frac{a}{q^k} n\right) \right|^2,$$

where $k \geq 2$ is a natural number. In the sequel, let

$$Z := \sum_{n=M+1}^{M+N} |a_n|^2.$$

With $k = 1$ in (1.1), it is

$$(1.2) \quad \ll (Q^2 + N)Z.$$

This is in fact the consequence of a more general result first introduced by H. Davenport and H. Halberstam [7] in which the Farey fractions in the outer sums of (1.1) can be replaced by any set of well-spaced points. Applying the said more general result, (1.1) is bounded above by

$$(1.3) \quad \ll (Q^{k+1} + QN)Z, \text{ and } \ll (Q^{2k} + N)Z$$

(see [19]). Literature abound on the subject of the classical large sieve. See [3], [6], [7], [8], [10], [12], [13] and [14]. In [19] it was proved that the sum (1.1) can be estimated by

$$(1.4) \quad \ll \left(Q^{k+1} + \left(NQ^{1-1/\kappa} + N^{1-1/\kappa} Q^{1+k/\kappa} \right) N^\varepsilon \right) Z,$$

where $\kappa := 2^{k-1}$ and the implied constant depends on ε and k . Furthermore, when appropriate, some of the constants c_i 's and the implied constants in $\ll$ in the remainder of this paper will depend on ε or both ε and k . In [1] and [2] this bound was improved for $k = 2$. Extending the elementary method in [1] to higher power moduli, we here establish the following bound for (1.1).

Theorem 1: *We have*

$$(1.5) \quad \sum_{q \leq Q} \sum_{\substack{a=1 \\ (a,q)=1}}^{q^k} \left| \sum_{n=M+1}^{M+N} a_n e\left(\frac{a}{q^k} n\right) \right|^2 \ll (\log \log 10NQ)^{k+1} (Q^{k+1} + N + N^{1/2+\varepsilon} Q^k) Z.$$

For $k \geq 3$ Theorem 1 improves the classical bounds (1.3) as well as Zhao's bound (1.4) in the range $N^{1/(2k)+\varepsilon} \ll Q \ll N^{(\kappa-2)/(2(k-1)\kappa-2k)-\varepsilon}$. In particular, for $k = 3$ we obtain an improvement in the range $N^{1/6+\varepsilon} \ll Q \ll N^{1/5-\varepsilon}$. We note that for a large k the exponent $(\kappa-2)/(2(k-1)\kappa-2k)$ is close to $1/(2(k-1))$.

Extending the Fourier analytic methods in [2], [19], we establish another bound for cubic moduli which improves the bounds (1.3), (1.4) in the range $N^{7/25+\varepsilon} \ll Q \ll N^{1/3-\varepsilon}$.

Theorem 2: *Suppose that $1 \leq Q \leq N^{1/2}$. Then we have*

$$(1.6) \quad \sum_{q \leq Q} \sum_{\substack{a=1 \\ (a,q)=1}}^{q^3} \left| \sum_{n=M+1}^{M+N} a_n e\left(\frac{a}{q^3} n\right) \right|^2 \ll \begin{cases} N^\varepsilon (Q^4 + N^{9/10} Q^{6/5}) Z, & \text{if } N^{7/24} \leq Q \leq N^{1/2}, \\ N Q^{6/7+\varepsilon} Z, & \text{if } 1 \leq Q < N^{7/24}. \end{cases}$$

Unfortunately, our Fourier analytic method does not yield any improvement if $k \geq 4$.

2. PROOF OF THEOREM 1

Let $\mathcal{S}$ be the set of k -th powers of natural numbers. Let $Q_0 \geq \sqrt{N}$. Set

$$\mathcal{S}(Q_0) = \mathcal{S} \cap (Q_0, 2Q_0].$$

We first note, by classical large sieve, setting $Q = \sqrt{N}$ in (1.2),

$$(2.1) \quad \sum_{q \leq \sqrt{N}} \sum_{\substack{a=1 \\ (a,q)=1}}^q \left| \sum_{n=M+1}^{M+N} a_n e\left(\frac{a}{q} n\right) \right|^2 \leq 2NZ.$$

Let

$$\mathcal{S}_t(Q_0) = \{q \in \mathbb{N} : tq \in \mathcal{S}(Q_0)\}.$$

Let $t = p_1^{v_1} \cdots p_n^{v_n}$ be the prime decomposition of t . Furthermore, let

$$u_i := \left\lceil \frac{v_i}{k} \right\rceil,$$

where for $x \in \mathbb{R}$, $\lceil x \rceil = \min\{k \in \mathbb{Z} : k \geq x\}$ is the ceiling of x . Moreover, set

$$f_t = p_1^{u_1} \cdots p_n^{u_n}.$$

Therefore, for all $q_0^k = q \in \mathcal{S}$, q is divisible by t if and only if q_0 is divisible by f_t . Therefore, we have

$$\mathcal{S}_t(Q_0) = \{q_1^k g_t : Q_0^{1/k}/f_t < q_1 \leq (2Q_0)^{1/k}/f_t\},$$

where

$$g_t := \frac{f_t^k}{t}.$$

Moreover we note that

$$\mathcal{S}_t(Q_0) \subset (Q_0/t, 2Q_0/t]$$

and that

$$(2.2) \quad |\mathcal{S}_t(Q_0)| \leq \frac{(2Q_0)^{1/k}}{f_t}.$$

We set for $m \in \mathbb{N}$, $l \in \mathbb{Z}$ with $(m, l) = 1$

$$(2.3) \quad A_t(u, m, l) = \max_{Q_0/t \leq y \leq 2Q_0/t} |\{q \in \mathcal{S}_t(Q_0) \cap (y, y+u] : q \equiv l \pmod{m}\}|.$$

Let $\delta_t(m, l)$ be the number of solutions x to the congruence

$$x^k g_t \equiv l \pmod{m}.$$

We now use Theorem 2 in [1] with $Q_0 \geq \sqrt{N}$:

Theorem 3: *Assume that for all $t \in \mathbb{N}$, $m \in \mathbb{N}$, $l \in \mathbb{Z}$, $u \in \mathbb{R}$ with $t \leq \sqrt{N}$, $m \leq \sqrt{N}/t$, $(m, l) = 1$, $mQ_0/\sqrt{N} \leq u \leq Q_0/t$ the conditions*

$$(2.4) \quad A_t(u, m, l) \leq C \left(1 + \frac{|\mathcal{S}_t(Q_0)|/m}{Q_0/t} \cdot u \right) \delta_t(m, l),$$

$$(2.5) \quad \sum_{\substack{l=1 \\ (m, l)=1}}^m \delta_t(m, l) \leq m,$$

$$(2.6) \quad \delta_t(m, l) \leq X$$

hold for some suitable positive numbers C and X . Then,

$$(2.7) \quad \sum_{q \in \mathcal{S}(Q_0)} \sum_{\substack{a=1 \\ (a, q)=1}}^q \left| \sum_{n=M+1}^{M+N} a_n e \left(\frac{a}{q} n \right) \right|^2 \leq c_0 C (\min\{Q_0 X, N\} + Q_0) \left(\sqrt{N} \log \log 10N + \max_{r \leq \sqrt{N}} \sum_{t|r} |\mathcal{S}_t(Q_0)| \right) Z.$$

First, we have to check the validity of the conditions (2.4), (2.5) and (2.6). Conditions (2.4) and (2.5) are obviously satisfied with C absolute. We further suppose that $(g_t, m) = 1$ for otherwise $\delta_t(m, l) = 0$ since $(m, l) = 1$. Therefore, we must estimate the number of solutions to

$$(2.8) \quad x^k \equiv \overline{g_t} l \pmod{m},$$

where $\overline{g_t}$ is the multiplicative inverse of g_t modulo m . By the virtue of the Chinese remainder theorem, it suffices to estimate the number of solutions to (2.8) with m as a prime power, say $m = p^e$, for $p \in \mathbb{P}$ and $e \in \mathbb{N}$. Note that the function

$$\sigma_k : (\mathbb{Z}/p^e \mathbb{Z})^* \longrightarrow (\mathbb{Z}/p^e \mathbb{Z})^* : x \longrightarrow x^k$$

is an endomorphism. Hence it is enough to estimate the size of its kernel $\ker(\sigma_k)$. If $k = \pi_1^{a_1} \cdots \pi_h^{a_h}$ is the prime decomposition of k , then

$$\sigma_k = \prod_{i=1}^h \sigma_{\pi_i}^{a_i}.$$

Thus,

$$(2.9) \quad |\ker \sigma_k| \leq \prod_{i=1}^h |\ker \sigma_{\pi_i}|^{a_i}.$$

Hence, it suffices to estimate the size of $|\ker \sigma_\pi|$ for prime numbers π .

For $p \in \mathbb{P}$,

$$x^\pi - 1 \equiv 0 \pmod{p}$$

has at most π solutions. By elementary result (see [15], for example), a solution, $a \pmod{p^e}$ with $e \geq 1$, of the congruence

$$(2.10) \quad x^\pi - 1 \equiv 0 \pmod{p^e}$$

lifts to more than one solution to

$$x^\pi - 1 \equiv 0 \pmod{p^{e+1}}$$

only when $p | \pi a^{\pi-1}$ and $p^{e+1} | a^\pi - 1$. If $p \neq \pi$, $p | \pi a^{\pi-1}$ implies $p | a$, but it is not possible that $p^{e+1} | a^\pi - 1$ as $(a^\pi - 1, a) = 1$. Thus, in this case (2.10) has at most π solutions for all $e \geq 1$. In the following, we consider the case $p = \pi$.

By Fermat's little theorem, there exists only one solution of the congruence

$$x^\pi - 1 \equiv 0 \pmod{\pi},$$

namely $1 \pmod{\pi}$. This solution lifts to exactly π solutions to

$$x^\pi - 1 \equiv 0 \pmod{\pi^2},$$

namely

$$1, 1 + \pi, 1 + 2\pi, \dots, 1 + (\pi - 1)\pi \pmod{\pi^2}.$$

More generally, if $a \pmod{\pi^e}$ is a solution to

$$(2.11) \quad x^\pi - 1 \equiv 0 \pmod{\pi^e},$$

then, if a lifts to solutions to

$$x^\pi - 1 \equiv 0 \pmod{\pi^{e+1}},$$

they are of the form

$$(2.12) \quad a, a + \pi^e, a + 2\pi^e, \dots, a + (\pi - 1)\pi^e \pmod{\pi^{e+1}}.$$

Assume there are $j_1, j_2 \in \{0, \dots, \pi - 1\}$, $j_1 \neq j_2$ such that both $a + j_1\pi^e$ and $a + j_2\pi^e$ lift to solutions modulo π^{e+2} . Then $\pi^{e+2} \mid (a + j_1\pi^e)^\pi - 1$ and $\pi^{e+2} \mid (a + j_2\pi^e)^\pi - 1$, hence

$$(a + j_1\pi^e)^\pi - (a + j_2\pi^e)^\pi = (j_1 - j_2)\pi^e \sum_{i=0}^{\pi-1} (a + j_1\pi^e)^{\pi-1-i} (a + j_2\pi^e)^i$$

is divisible by π^{e+2} . If $e \geq 2$, this implies $a \equiv 0 \pmod{\pi}$, but then a cannot be a solution to (2.11). Therefore, if $e \geq 2$, only one of the solutions (2.12) lifts to a solution modulo π^{e+2} . From this we infer that the number of solutions to (2.11) never exceeds π^2 , *i.e.*

$$|\ker \sigma_\pi| \leq \pi^2.$$

Combining this with (2.9), we get

$$|\ker \sigma_k| \leq k^2.$$

Therefore, by the Chinese remainder theorem, we obtain

$$\delta_t(m, l) \leq k^{2\omega(m)},$$

where $\omega(m)$ is the number of distinct prime divisors of m . Since $2^{\omega(m)}$ is the number of square-free divisors of m , we have

$$k^{2\omega(m)} \leq \tau(m)^{2 \log_2 k} \ll m^\varepsilon,$$

where $\tau(m)$ is the number of divisors of m . Thus, if $m \leq \sqrt{N}$, (2.6) holds with

$$X \ll N^\varepsilon.$$

Now, by Theorem 3,

$$(2.13) \quad \sum_{q \in \mathcal{S}(Q_0)} \sum_{\substack{a=1 \\ (a,q)=1}}^q \left| \sum_{n=M+1}^{M+N} a_n e\left(\frac{a}{q}n\right) \right|^2$$

is majorized by

$$\ll (\min\{Q_0 N^\varepsilon, N\} + Q_0) \left(\sqrt{N} \log \log(10N) + \max_{r \leq \sqrt{N}} \sum_{t|r} Q_0^{1/k} f_t^{-1} \right) Z.$$

The function

$$G(r) = \sum_{t|r} \frac{1}{f_t}$$

is clearly multiplicative. If r is a prime power p^v , then

$$G(r) \leq 1 + k \left(\frac{1}{p} + \frac{1}{p^2} + \dots \right) = 1 + \frac{k}{p-1} \leq \left(1 + \frac{1}{p-1} \right)^k = \left(\frac{p^v}{\varphi(p^v)} \right)^k.$$

Hence, for all $r \in \mathbb{N}$ we have

$$(2.14) \quad G(r) \leq \left(\frac{r}{\varphi(r)} \right)^k \ll (\log \log 10r)^k.$$

Hence (2.13) is

$$\ll (\log \log 10NQ_0)^{k+1} (\sqrt{N} + Q_0^{1/k}) (\min\{Q_0 N^\varepsilon, N\} + Q_0).$$

The above is always majorized by

$$\ll (\log \log 10NQ_0)^{k+1} \left(Q_0^{1+1/k} + N^{1/2+\varepsilon} Q_0 \right).$$

Summing over all relevant dyadic intervals and combining with (2.1), we see that (1.1) is majorized by

$$\ll (\log \log 10NQ)^{k+1} (Q^{k+1} + N + N^{1/2+\varepsilon} Q^k) Z.$$

Therefore, our result follows. $\square$

3. PROOF OF THEOREM 2

3.1. Reduction to Farey fractions in short intervals. As in [1], [2], our starting point is the following general large sieve inequality.

Lemma 1: *Let $(\alpha_r)_{r \in \mathbb{N}}$ be a sequence of real numbers. Suppose that $0 < \Delta \leq 1/2$ and $R \in \mathbb{N}$. Put*

$$(3.1) \quad K(\Delta) := \max_{\alpha \in \mathbb{R}} \sum_{\substack{r=1 \\ \|\alpha_r - \alpha\| \leq \Delta}}^R 1,$$

where $\|x\|$ denotes the distance of a real x to its closest integer. Then

$$\sum_{r=1}^R |S(\alpha_r)|^2 \leq c_1 K(\Delta) (N + \Delta^{-1}) Z.$$

In the sequel, we suppose that $\mathcal{S}$ is the set of cubes of natural numbers and that $\alpha_1, \dots, \alpha_R$ is the sequence of Farey fractions a/q with $q \in \mathcal{S}(Q_0)$, $1 \leq a \leq q$ and $(a, q) = 1$, where $Q_0 \geq 1$. We further suppose that $\alpha \in \mathbb{R}$ and $0 < \Delta \leq 1/2$. Put

$$I(\alpha) := [\alpha - \Delta, \alpha + \Delta] \quad \text{and} \quad P(\alpha) := \sum_{\substack{q \in \mathcal{S} \cap (Q_0, 2Q_0] \\ (a, q) = 1 \\ a/q \in I(\alpha)}} 1.$$

Then we have

$$K(\Delta) = \max_{\alpha \in \mathbb{R}} P(\alpha).$$

Therefore, the proof of Theorem 2 reduces to estimating $P(\alpha)$.

As in [1] and [2], we begin with an idea of D. Wolke [18]. Let τ be a positive number with

$$(3.2) \quad 1 \leq \tau \leq \frac{1}{\sqrt{\Delta}}.$$

In [1] and [2] we put $\tau := 1/\sqrt{\Delta}$, but in fact our method works for all τ satisfying (3.2). We will later fix τ in an optimal manner. In the said earlier papers, $\tau = 1/\sqrt{\Delta}$ was the optimal choice.

By Dirichlet's approximation theorem, α can be written in the form

$$\alpha = \frac{b}{r} + z,$$

where

$$(3.3) \quad r \leq \tau, \quad (b, r) = 1, \quad |z| \leq \frac{1}{r\tau}.$$

Thus, it suffices to estimate $P(b/r + z)$ for all b, r, z satisfying (3.3).

We further note that we can restrict ourselves to the case when

$$(3.4) \quad z \geq \Delta.$$

If $|z| < \Delta$, then

$$P(\alpha) \leq P\left(\frac{b}{r} - \Delta\right) + P\left(\frac{b}{r} + \Delta\right).$$

Furthermore, we have

$$\Delta \leq \frac{1}{\tau^2} \leq \frac{1}{r\tau}.$$

Therefore this case can be reduced to the case $|z| = \Delta$. Moreover, as $P(\alpha) = P(-\alpha)$, we can choose z positive. So we can assume (3.4), without any loss of generality.

Summarizing the above observations, we deduce

Lemma 2: *We have*

$$(3.5) \quad K(\Delta) \leq 2 \max_{\substack{r \in \mathbb{N} \\ r \leq \tau}} \max_{\substack{b \in \mathbb{Z} \\ (b, r) = 1}} \max_{\Delta \leq z \leq 1/(\tau r)} P\left(\frac{b}{r} + z\right).$$

3.2. Estimation of $P(b/r + z)$ - first way. We now prove a first estimate for $P(b/r + z)$ by using some results in [1]. In the sequel, we suppose that the conditions (3.2), (3.3) and (3.4) are satisfied.

By inequality (41) in [1], we have

$$(3.6) \quad P\left(\frac{b}{r} + z\right) \leq 1 + 6 \sum_{t|r} \sum_{\substack{0 < m \leq 4rzQ_0/t \\ (m, r/t) = 1}} A_t\left(\frac{\Delta Q_0}{tz}, \frac{r}{t}, -\bar{b}m\right),$$

where $A_t(u, m, l)$ is defined as in (2.3) and $\bar{b}$ is the multiplicative inverse of b modulo r . By the results of section 2, for $\mathcal{S}$ the set of cubes, the conditions (2.4), (2.5) and (2.6) with $X = \Delta^{-\varepsilon}$ are satisfied for all $t \in \mathbb{N}$, $m \in \mathbb{N}$, $l \in \mathbb{Z}$, $u \in \mathbb{R}$ with $t \leq \tau$, $m \leq \tau/t$, $(m, l) = 1$, $mQ_0/\tau \leq u \leq Q_0/t$. Conditions (2.4) and (2.6) imply

$$(3.7) \quad \sum_{\substack{0 < m \leq 4rzQ_0/t \\ (m, r/t) = 1}} A_t\left(\frac{\Delta Q_0}{tz}, \frac{r}{t}, -\bar{b}m\right) \leq C \left(1 + \frac{\Delta t |\mathcal{S}_t(Q_0)|}{rz}\right) \frac{4rzQ_0X}{t}$$

From (3.6), (3.7) and

$$\sum_{t|r} \frac{1}{t} \leq \prod_{p|r} \left(1 + \frac{1}{p} + \frac{1}{p^2} + \dots\right) = \prod_{p|r} \frac{p}{p-1} = \frac{r}{\varphi(r)} \leq c_2 \log \log 10r,$$

we derive

$$(3.8) \quad P\left(\frac{b}{r} + z\right) \leq 1 + c_3 Q_0 X \left(rz \log \log 10r + \Delta \sum_{t|r} |\mathcal{S}_t(Q_0)|\right).$$

Furthermore, by (2.2) and (2.14), we have

$$\sum_{t|r} |\mathcal{S}_t(Q_0)| \ll (\log \log 10r)^3 Q_0^{1/3}.$$

Thus, from (3.8) and the fact that $r \leq \tau = \Delta^{-1/2}$, we obtain

Proposition 1: *Let $\mathcal{S}$ be the set of cubes of natural numbers. Suppose that the conditions (3.2), (3.3) and (3.4) are satisfied. Then we have*

$$(3.9) \quad P\left(\frac{b}{r} + z\right) \leq 1 + c_4 \Delta^{-\varepsilon} \left(Q_0^{4/3} \Delta + Q_0 rz\right).$$

3.3. Estimation of $P(b/r + z)$ - second way. We now prove a second estimate for $P(b/r + z)$ by extending the Fourier analytic methods in [2], [19] to cubic moduli. The following bound for $P(b/r + z)$ can be proved in the same manner as Lemma 2 in [2].

Lemma 3: *Let $\mathcal{S}$ be the set of cubes of natural numbers. Suppose that*

$$(3.10) \quad \frac{Q_0 \Delta}{z} \leq \delta \leq Q_0.$$

Then,

$$(3.11) \quad P\left(\frac{b}{r} + z\right) \leq c_5 \left(1 + \frac{1}{\delta} \int_{Q_0}^{2Q_0} \Pi(\delta, y) dy\right),$$

where $I(\delta, y) = [y^{1/3} - c_6 \delta / Q_0^{2/3}, y^{1/3} + c_6 \delta / Q_0^{2/3}]$, $J(\delta, y) = [(y - 4\delta)rz, (y + 4\delta)rz]$ and

$$(3.12) \quad \Pi(\delta, y) = \sum_{q \in I(\delta, y)} \sum_{\substack{m \in J(\delta, y) \\ m \equiv -bq^3 \pmod{r} \\ m \neq 0}} 1.$$

We shall prove the following

Proposition 2: *Let $\mathcal{S}$ be the set of cubes of natural numbers. Suppose that the conditions (3.2), (3.3) and (3.4) are satisfied. Then we have*

$$(3.13) \quad P\left(\frac{b}{r} + z\right) \leq c_7 \Delta^{-\varepsilon} \left(Q_0^{4/3} \Delta + Q_0^{1/3} \Delta r^{-1/3} z^{-1} + \Delta^{-1/2} (rz)^{1/2}\right).$$

To derive Proposition 2 from Lemma 3, we need the following standard results from Fourier analysis.

Lemma 4: (Poisson summation formula, [5]) *Let $f(x)$ be a complex-valued function on the real numbers that is piecewise continuous with only finitely many discontinuities and for all real numbers a satisfies*

$$f(a) = \frac{1}{2} \left(\lim_{x \rightarrow a^-} f(x) + \lim_{x \rightarrow a^+} f(x) \right).$$

Moreover, suppose that $f(x) \leq c_8(1 + |x|)^{-c}$ for some $c > 1$. Then,

$$\sum_{n \in \mathbb{Z}} f(n) = \sum_{n \in \mathbb{Z}} \hat{f}(n), \text{ where } \hat{f}(x) := \int_{-\infty}^{\infty} f(y) e(xy) dy,$$

the Fourier transform of $f(x)$.

Lemma 5: (see [19], for example) *For $x \in \mathbb{R} \setminus \{0\}$ define*

$$\phi(x) := \left(\frac{\sin \pi x}{2x} \right)^2, \text{ and } \phi(0) := \lim_{x \rightarrow 0} \phi(x) = \frac{\pi^2}{4}.$$

Then $\phi(x) \geq 1$ for $|x| \leq 1/2$, and the Fourier transform of the function $\phi(x)$ is

$$\hat{\phi}(s) = \frac{\pi^2}{4} \max\{1 - |s|, 0\}.$$

Lemma 6: (see Lemma 3.1. in [9]) *Let $F : [a, b] \rightarrow \mathbb{R}$ be twice differentiable. Assume that $|F'(x)| \geq u > 0$ for all $x \in [a, b]$. Then,*

$$\left| \int_a^b e^{iF(x)} dx \right| \leq \frac{c_9}{u}.$$

Lemma 7: (see Lemma 4.3.1. in [4]) *Let $F : [a, b] \rightarrow \mathbb{R}$ be twice continuously differentiable. Assume that $|F''(x)| \geq u > 0$ for all $x \in [a, b]$. Then,*

$$\left| \int_a^b e^{iF(x)} dx \right| \leq \frac{c_{10}}{\sqrt{u}}.$$

We shall also need the following estimates for cubic exponential sums.

Lemma 8: (see [11], [17]) *Let $c \in \mathbb{N}$, $k, l \in \mathbb{Z}$ with $(k, c) = 1$. Then,*

$$\sum_{d=1}^c e\left(\frac{kd^3 + ld}{c}\right) \leq c_{11} c^{1/2+\varepsilon}(l, c).$$

Furthermore,

$$\sum_{d=1}^c e\left(\frac{kd^3}{c}\right) \leq c_{11} c^{2/3}.$$

Proof of Proposition 2: We put

$$(3.14) \quad \delta := \frac{Q_0 \Delta}{z}.$$

By Lemma 5, (3.12) can be estimated by

$$(3.15) \quad \Pi(\delta, y) \leq \sum_{q \in \mathbb{Z}} \phi\left(\frac{q - y^{1/3}}{2c_6 \delta / Q_0^{2/3}}\right) \sum_{\substack{m \in \mathbb{Z} \\ m \equiv -bq^3 \pmod{r}}} \phi\left(\frac{m - yrz}{8\delta rz}\right).$$

Using Lemma 4 after a linear change of variables, we transform the inner sum on the right-hand side of (3.15) into

$$\sum_{\substack{m \in \mathbb{Z} \\ m \equiv -bq^3 \pmod{r}}} \phi\left(\frac{m - yrz}{8\delta rz}\right) = 8\delta z \sum_{j \in \mathbb{Z}} e\left(\frac{jbq^3}{r} + jyz\right) \hat{\phi}(8j\delta z).$$

Therefore, we get for the double sum on the right-hand side of (3.15)

$$(3.16) \quad \begin{aligned} & \sum_{q \in \mathbb{Z}} \phi\left(\frac{q - y^{1/3}}{2c_6 \delta / Q_0^{2/3}}\right) \sum_{\substack{m \in \mathbb{Z} \\ m \equiv -bq^3 \pmod{r}}} \phi\left(\frac{m - yrz}{8\delta rz}\right) \\ &= 8\delta z \sum_{j \in \mathbb{Z}} e(jyz) \hat{\phi}(8j\delta z) \sum_{d=1}^{\tilde{r}} e\left(\frac{\tilde{j}bd^3}{\tilde{r}}\right) \sum_{\substack{k \in \mathbb{Z} \\ k \equiv d \pmod{\tilde{r}}}} \phi\left(\frac{k - y^{1/3}}{2c_6 \delta / Q_0^{2/3}}\right), \end{aligned}$$

where $\tilde{r} := r/(r, j)$ and $\tilde{j} := j/(r, j)$. Again using Lemma 4 after a linear change of variables, we transform the inner sum on the right-hand side of (3.16) into

$$(3.17) \quad \sum_{\substack{k \in \mathbb{Z} \\ k \equiv d \pmod{\tilde{r}}}} \phi\left(\frac{k - y^{1/3}}{2c_6 \delta / Q_0^{2/3}}\right) = \frac{2c_6 \delta}{\tilde{r} Q_0^{2/3}} \sum_{l \in \mathbb{Z}} e\left(l \cdot \frac{d - y^{1/3}}{\tilde{r}}\right) \hat{\phi}\left(\frac{2c_6 l \delta}{\tilde{r} Q_0^{2/3}}\right).$$

From (3.16) and (3.17), we obtain

$$(3.18) \quad \begin{aligned} & \frac{1}{\delta} \int_{Q_0}^{2Q_0} \sum_{q \in \mathbb{Z}} \phi \left(\frac{q - y^{1/3}}{2c_6\delta/Q_0^{2/3}} \right) \sum_{\substack{m \in \mathbb{Z} \\ m \equiv -bq^3 \pmod{r}} } \phi \left(\frac{m - yrz}{8\delta rz} \right) dy \\ & \leq \frac{16c_6\delta z}{Q_0^{2/3}} \sum_{j \in \mathbb{Z}} \frac{\hat{\phi}(8j\delta z)}{\tilde{r}} \sum_{l \in \mathbb{Z}} \hat{\phi} \left(\frac{2c_6l\delta}{\tilde{r}Q_0^{2/3}} \right) \left| \sum_{d=1}^{\tilde{r}} e \left(\frac{\tilde{j}bd^3 + ld}{\tilde{r}} \right) \int_{Q_0}^{2Q_0} e \left(jyz - l \cdot \frac{y^{1/3}}{\tilde{r}} \right) dy \right|. \end{aligned}$$

Applying the Lemmas 5 and 8 to the right-hand side of (3.18), and taking $r \leq 1/\sqrt{\Delta}$ by (3.2) and (3.3) into account, we deduce

$$(3.19) \quad \begin{aligned} & \frac{1}{\delta} \int_{Q_0}^{2Q_0} \sum_{q \in \mathbb{Z}} \phi \left(\frac{q - y^{1/3}}{c_6\delta/Q_0^{2/3}} \right) \sum_{\substack{m \in \mathbb{Z} \\ m \equiv -bq^3 \pmod{r}} } \phi \left(\frac{m - yrz}{8\delta rz} \right) dy \\ & \leq \frac{c_{12}\delta z \Delta^{-\varepsilon}}{Q_0^{2/3}} \left(\sum_{|j| \leq 1/(8\delta z)} \frac{1}{\sqrt{\tilde{r}}} \sum_{\substack{|l| \leq (\tilde{r}Q_0^{2/3})/(2c_6\delta) \\ l \neq 0}} (l, \tilde{r}) \left| \int_{Q_0}^{2Q_0} e \left(jyz - l \cdot \frac{y^{1/3}}{\tilde{r}} \right) dy \right| + \sum_{|j| \leq 1/(8\delta z)} \frac{1}{\sqrt[3]{\tilde{r}}} \left| \int_{Q_0}^{2Q_0} e(jyz) dy \right| \right). \end{aligned}$$

If $j \neq 0$, then

$$\left| \int_{Q_0}^{2Q_0} e(jyz) dy \right| \leq \frac{1}{|j|z}.$$

If $j = 0$ and $l \neq 0$, then

$$\left| \int_{Q_0}^{2Q_0} e \left(jyz - l \cdot \frac{y^{1/3}}{\tilde{r}} \right) dy \right| \leq \frac{c_{13}Q_0^{2/3}}{|l|}$$

by Lemma 6 (take into account that $\tilde{r} = 1$ if $j = 0$). If $j \neq 0$ and $l \neq 0$, then Lemma 7 yields

$$\left| \int_{Q_0}^{2Q_0} e \left(jyz - l \cdot \frac{y^{1/3}}{\tilde{r}} \right) dy \right| \leq \frac{c_{14}\sqrt{\tilde{r}}Q_0^{5/6}}{\sqrt{|l|}}.$$

Therefore, the right-hand side of (3.19) is majorized by

$$(3.20) \quad \leq c_{15}\delta\Delta^{-\varepsilon} \left(zQ_0^{1/3} + \frac{1}{Q_0^{2/3}} \sum_{1 \leq j \leq 1/(8\delta z)} \frac{1}{j\sqrt[3]{\tilde{r}}} + z \sum_{1 \leq l \leq Q_0^{2/3}/(2c_6\delta)} \frac{1}{l} + zQ_0^{1/6} \sum_{1 \leq j \leq 1/(8\delta z)} \sum_{1 \leq l \leq \tilde{r}Q_0^{2/3}/(2c_6\delta)} \frac{(l, \tilde{r})}{\sqrt{l}} \right).$$

Now, we estimate the sums in the last line of (3.20). Using (3.2), (3.3) and (3.14), we obtain

$$(3.21) \quad \sum_{1 \leq l \leq Q_0^{2/3}/(2c_6\delta)} \frac{1}{l} \leq c_{16}\Delta^{-\varepsilon}.$$

Using the definition of $\tilde{r}$, (3.2), (3.3) and (3.14), we obtain

$$(3.22) \quad \sum_{1 \leq j \leq 1/(8\delta z)} \frac{1}{j\sqrt[3]{\tilde{r}}} = \frac{1}{\sqrt[3]{r}} \sum_{t|r} \sqrt[3]{t} \sum_{\substack{1 \leq j \leq 1/(8\delta z) \\ (r,j)=t}} \frac{1}{j} \leq \frac{c_{17}\Delta^{-\varepsilon}}{\sqrt[3]{r}} \sum_{t|r} t^{-2/3} \leq c_{18}\Delta^{-2\varepsilon} r^{-1/3}.$$

For $A \geq 1$, we have

$$\sum_{1 \leq l \leq A} \frac{(l, \tilde{r})}{\sqrt{l}} \leq \sum_{t|\tilde{r}} t \sum_{1 \leq l \leq A/t} \frac{1}{\sqrt{lt}} \ll \sqrt{A} \sum_{t|\tilde{r}} 1 \ll \tilde{r}^\varepsilon \sqrt{A}.$$

Therefore,

$$(3.23) \quad \sum_{1 \leq j \leq 1/(8\delta z)} \sum_{1 \leq l \leq \tilde{r} Q_0^{2/3}/(2c_6\delta)} \frac{(l, \tilde{r})}{\sqrt{l}} \leq \frac{c_{19} \Delta^{-\varepsilon} Q_0^{1/3}}{\sqrt{\delta}} \sum_{1 \leq j \leq 1/(8\delta z)} \sqrt{\tilde{r}}.$$

Using the definition of $\tilde{r}$, we obtain

$$(3.24) \quad \sum_{1 \leq j \leq 1/(8\delta z)} \sqrt{\tilde{r}} = \sqrt{\tilde{r}} \sum_{t|r} \frac{1}{\sqrt{t}} \sum_{\substack{1 \leq j \leq 1/(8\delta z) \\ (r,j)=t}} 1 \leq \frac{\sqrt{\tilde{r}}}{8\delta z} \sum_{t|r} \frac{1}{t^{3/2}} \leq \frac{c_{20} \sqrt{\tilde{r}}}{\delta z}.$$

Combining Lemma 3 and (3.19-3.24), we obtain

$$(3.25) \quad P\left(\frac{b}{r} + z\right) \leq c_7 \Delta^{-3\varepsilon} \left(1 + \delta z Q_0^{1/3} + \delta Q_0^{-2/3} r^{-1/3} + \delta^{-1/2} Q_0^{1/2} \sqrt{\tilde{r}}\right).$$

From (3.14) and (3.25), we infer the desired estimate. Note that the first term in the right-hand side of (3.25) can be absorbed into the last term on the right-hand side of (3.13) by (3.4). $\square$

3.4. Final proof of Theorem 2. Combining Propositions 1,2 and (3.3), we obtain

$$(3.26) \quad P\left(\frac{b}{r} + z\right) \leq c_{21} \Delta^{-\varepsilon} \left(Q_0^{4/3} \Delta + \min\left\{Q_0 r z, Q_0^{1/3} \Delta r^{-1/3} z^{-1}\right\} + \Delta^{-1/2} \tau^{-1/2}\right).$$

If

$$z \leq \Delta^{1/2} Q_0^{-1/3} r^{-2/3},$$

then

$$\min\left\{Q_0 r z, Q_0^{1/3} \Delta r^{-1/3} z^{-1}\right\} = Q_0 r z \leq Q_0^{2/3} \Delta^{1/2} r^{1/3}.$$

If

$$z > \Delta^{1/2} Q_0^{-1/3} r^{-2/3},$$

then

$$\min\left\{Q_0 r z, Q_0^{1/3} \Delta r^{-1/3} z^{-1}\right\} = Q_0^{1/3} \Delta r^{-1/3} z^{-1} \leq Q_0^{2/3} \Delta^{1/2} r^{1/3}.$$

From the above inequalities and (3.3), we deduce

$$(3.27) \quad \min\left\{Q_0 r z, Q_0^{1/3} \Delta r^{-1/3} z^{-1}\right\} \leq Q_0^{2/3} \Delta^{1/2} r^{1/3} \leq Q_0^{2/3} \Delta^{1/2} \tau^{1/3}.$$

Combining (3.26) and (3.27), we get

$$(3.28) \quad P\left(\frac{b}{r} + z\right) \leq c_{22} \Delta^{-\varepsilon} \left(Q_0^{4/3} \Delta \tau^\varepsilon + Q_0^{2/3} \Delta^{1/2} \tau^{1/3+\varepsilon} + \Delta^{-1/2} \tau^{-1/2}\right).$$

Now we choose

$$\tau := \begin{cases} N^{6/5} Q_0^{-4/5}, & \text{if } N^{7/8} \leq Q_0 \leq N^{3/2}, \\ Q_0^{4/7}, & \text{if } 1 \leq Q_0 < N^{7/8}, \end{cases} \quad \text{and } \Delta := \begin{cases} N^{-1}, & \text{if } N^{7/8} \leq Q_0 \leq N^{3/2}, \\ Q_0^{-8/7}, & \text{if } 1 \leq Q_0 < N^{7/8}. \end{cases}$$

Then the condition (3.2) is satisfied in each case, and from (3.28) and Lemmas 1,2, we obtain

$$(3.29) \quad \sum_{Q_0^{1/3} \leq q \leq (2Q_0)^{1/3}} \sum_{\substack{a=1 \\ (a,q)=1}}^{q^3} \left|S\left(\frac{a}{q^3}\right)\right|^2 \ll \begin{cases} N^\varepsilon \left(Q_0^{4/3} + N^{9/10} Q_0^{2/5}\right) Z, & \text{if } N^{7/8} \leq Q_0 \leq N^{3/2}, \\ N Q_0^{2/7+\varepsilon} Z, & \text{if } 1 \leq Q_0 < N^{7/8}. \end{cases}$$

We can divide the interval $[1, Q]$ into $O(\log Q)$ subintervals of the form $\left[Q_0^{1/3}, (2Q_0)^{1/3}\right]$, where $1 \leq Q_0 \leq Q^3$.

Hence, the result of Theorem 2 follows from (3.29). $\square$
